PROJECT DESIGN PHASE-I
Problem – Solution Fit Canvas

Electric Vehicle Market Performance & Insights

Date	26 October 2026	**Team ID**	
Project Name	Electric Vehicle Market Performance & Insights	**Team Member**	Self

Problem–solution fit summary: The project addresses the difficulty of exploring and communicating EV market and technology patterns across a large supplied dataset. It provides an interactive Tableau dashboard and two stories through a public website. This is a proposed fit based on the capstone personas and project scope; no real customer interviews or adoption testing are claimed.

1. CUSTOMER SEGMENTS

Primary: EV market strategy directors and automotive business-intelligence managers who need to compare manufacturers, recorded sales, vehicle categories and customer indicators. Secondary: sustainable-mobility researchers and other stakeholders exploring EV technology patterns.

Project implication: They need clear, comparable evidence and a quick way to explore many manufacturers, models and technical measures. This segment is based on the capstone personas, not validated interviews.

6. CUSTOMER CONSTRAINTS

The supplied test dataset has many records and fields; some measures contain missing values. Users may have limited time or Tableau experience. The dataset is not verified real-world market data.

Project implication: Avoid treating record counts as market share or country record counts as factory output. Ratings and sales summaries must use appropriate aggregations and disclose missing-data limitations.

5. AVAILABLE SOLUTIONS

Spreadsheets and static tables; manufacturer or vehicle websites; standalone charts; general market reports; and manually prepared presentations.

Project implication: These options may be fragmented, difficult to compare consistently, or not interactive. This project consolidates selected dataset measures into Tableau visualisations, a dashboard, two stories and a public webpage.

2. JOBS-TO-BE-DONE / PROBLEMS

Compare recorded annual sales by manufacturer; explore battery technology distribution; compare driving range and battery capacity; review manufacturing-country records; examine customer ratings; communicate patterns.

Project implication: Users need a consistent, accessible view rather than manually filtering and comparing thousands of records across separate tables.

9. PROBLEM ROOT CAUSE

Relevant measures are spread across a large dataset with many manufacturers, models and technical fields. Without consistent aggregation, filtering and visual presentation, comparisons take time and can be misunderstood.

Project implication: Some fields contain missing values, and the dataset's test-data status means users need context to avoid unsupported real-world conclusions.

7. BEHAVIOUR

Users open the public project page, inspect the overview and methodology, open the Tableau dashboard, apply available filters, compare charts, then use the two Tableau stories to review and share insights.

Project implication: The intended behaviour is exploratory and evidence-led. Actual user behaviour has not been measured; this describes the designed usage journey.

3. TRIGGERS

A need to prepare an EV market overview, compare manufacturer performance, explore battery technologies, investigate range/capacity patterns, or present an evidence-based summary to stakeholders.

Project implication: The project is useful when a stakeholder needs a quick, visual starting point for exploring the supplied dataset.

4. EMOTIONS: BEFORE / AFTER

Before: users may feel overwhelmed by numerous records, unsure where to start, and uncertain how to compare measures. After: users should find it easier to navigate the analysis and communicate visible patterns, while remaining aware of data limitations.

Project implication: This is an expected experience based on the solution design, not a measured user-study result.

10. YOUR SOLUTION

A Tableau Public analysis built from the supplied ev_market_test.csv dataset: eight visualisations, one interactive dashboard and two stories—EV Market Performance and EV Technology and Customer Insights—published with a public website hosted on GitHub Pages.

Project implication: The solution supports comparisons of recorded sales, battery types, range, capacity, manufacturing-country records and customer ratings. It includes methodology and caveats. It does not claim live market data, predictive modelling, Snowflake, or automated pipelines.

Scope and evidence note: The dataset is a supplied test dataset. Annual sales are recorded annual_sales_units aggregated by the selected dimension; country counts are vehicle records, not manufacturing output; battery-type counts are dataset records, not verified market share. Relationships shown by charts are descriptive and do not prove causation. Team ID is intentionally blank; team member is Self.
