Project Design Phase-I
Problem – Solution Fit Template

Date	26 October 2026	**Team ID**	
Project Name	Electric Vehicle Market Performance & Insights	**Team Member**	Self
Maximum Marks	2 Marks		

Problem–Solution Fit: This canvas describes target users, their needs and constraints, existing alternatives, behavioural triggers, and how the project addresses the problem.

1. CUSTOMER SEGMENTS Primary: EV market strategy directors and automotive business-intelligence managers. Secondary: sustainable-mobility researchers and stakeholders interested in EV technology. **Project implication:** Need clear comparisons of manufacturers, recorded sales, vehicle categories, battery technologies, driving range and customer ratings. These are capstone persona assumptions, not validated interviews.	**6. CUSTOMER CONSTRAINTS** The supplied dataset contains many records and fields, and some measures have missing values. Users may have limited time or Tableau experience. The file is a supplied test dataset. **Project implication:** Explain missing values and data scope. Vehicle-record counts are not market share, and country record counts are not factory production.	**5. AVAILABLE SOLUTIONS** Spreadsheets, static tables, manufacturer websites, standalone charts and general market reports. **Project implication:** These can be fragmented or difficult to compare consistently. This project consolidates selected measures into Tableau visualisations, a dashboard, two stories and a public webpage.
2. JOBS-TO-BE-DONE / PROBLEMS Compare recorded annual sales by manufacturer; explore battery-type distribution; compare driving range and battery capacity; review manufacturing-country records and customer ratings; communicate patterns. **Project implication:** Users need an interactive, consistent view instead of manually filtering and comparing many records.	**9. PROBLEM ROOT CAUSE** Relevant measures are spread across many manufacturers, models and technical fields. Without consistent aggregation, filtering and visual presentation, comparisons take time and can be misunderstood. **Project implication:** Missing values and the test-data status require clear methodology and careful interpretation.	**7. BEHAVIOUR** Open the public website, review the project overview and methodology, open the Tableau dashboard, use available filters, compare charts, then view both Tableau stories. **Project implication:** This is the designed usage journey. Actual user behaviour has not been measured.
3. TRIGGERS A need to prepare an EV market overview, compare manufacturer performance, explore battery technologies, investigate range/capacity patterns or present a visual summary. **Project implication:** The project provides a visual starting point for exploring the supplied dataset.	**4. EMOTIONS: BEFORE / AFTER** Before: users may feel overwhelmed by numerous records and unsure how to compare measures. After: users are expected to navigate the analysis more easily and communicate visible patterns with appropriate caution. **Project implication:** This is an expected experience based on design, not a measured user study.	**10. YOUR SOLUTION** A Tableau Public analysis using ev_market_test.csv, with eight visualisations, one interactive dashboard and two stories: EV Market Performance and EV Technology and Customer Insights. The work is presented through a GitHub Pages website. **Project implication:** Supports exploration of recorded sales, battery types, range, capacity, country records and ratings. No live data, predictive model, Snowflake database or automated pipeline is claimed.
8. CHANNELS OF BEHAVIOUR GitHub Pages website, embedded Tableau Public dashboard, direct dashboard link, both published Tableau story links, and GitHub repository/README. **Project implication:** Stakeholders can access and share the analysis in a browser. Access depends on internet availability and Tableau Public publication settings.		

Scope and evidence note: The supplied ev_market_test.csv is a test dataset. Annual sales are recorded annual_sales_units aggregated by the selected dimension; country counts are vehicle records, not manufacturing output; battery-type counts are dataset records, not verified market share. Chart relationships are descriptive and do not prove causation. Personas and expected emotions are design assumptions, not interview or usability-test results.
